Description of Sensor Function

The ultrasonic sensor works like a retroreflective sensor. It transmits ultrasonic packages in quick succession and responds to their reflection off a reference object at a defined distance. The distance T to the reference object can be taught in. The sensor has a switch output. This output switches if the reference object is not detected, which happens when another object is located between the sensor and the reference object. The limit of the switching range is derived as follows: T - 5 %.

Notes

- The distance T of the reference object must not be changed during operation. If the distance T changes, it will have to be taught-in again.
- The reference object must not be removed during operation.

Teach-In the Distance to the Reference Object

Proceed as follows to teach in the distance T to the reference object:

1. Connect the sensor and turn on the operating voltage.
2. Place the reference object at the required distance.
3. Connect the teach-in input (ET) to $-U_B$. This can be done using the pushbutton or the controller.
   The LED will start flashing after 3 seconds to indicate that the sensor is ready to start the teach-in process (*).
4. Disconnect the teach-in input (ET) with $-U_B$. The distance T to the reference object has now been taught in (*).

(*) If no object is detected within the sensing range of the sensor, the sensor will start flashing at a faster rate. The switching point remains unchanged.

Mounting instruction

If the sensor is operated at temperatures below 0 °C, use the supplied distance plate. Only use the two rearmost mounting holes (located opposite to the transducer) for mounting the sensor.

Safety Note

The use of this device in applications, where the safety of persons depends from the devices function, is not allowed!
